

Pan

Dimensional inspection of vials

The Vimec Pan inspection system is designed for dimensional inspection of borosilicate glass vials. The Pan system is installed in the forming machine and inspects the top of the vial, while the vial is held in the machine chuck.

Inspection principle

The vial is presented to the Pan system while it is held in the chuck of the forming machine. During the rotation of the chuck, multiple images of the top of the vial are taken by the Pan system. Reject criteria can be set on the dimensional aspects of the vial according to the customer requirements. The Pan system will provide a reject signal to trigger the reject unit if the vial dimensions are not within the tolerances.
